First year I had a lot of interesting subjects.

We did a communications subject which actually helps a lot in just in our field, because you need to be able to not only write memos and letters but just communicating with clients, customers and people within your own industry.

In third and fourth year you get to choose the subjects that you want to specialise in more or less and each one of those has actually helped me in my field because they just open up your mind to the possibility of what you'll actually be having to do when you get into the field.

Working at JBA for the past four years and I've done hundreds of projects with them.

I got to work on forty-six odd schools . One of my favourites happen to be a school in Sherbrooke.

The reason why I actually fell in love with this project was because the Principal at the time was of the belief that even if the Government was not willing to fund a couple of his ideas that the school would actually source money for it and what they were actually trying to make sure, that this project was a lot greener. This excited me.

I've come into a company where everyone seems to be multi-disciplined.

They do more than one service at a time. Generally when you do an engineering course with other unis you get to just focus on one discipline which might be electrical, mechanical or fire. Or even the hydraulics itself.

Having done Architectural Engineering it actually enables us to be able to do all four.

Hopefully within the next five years I'll have enough experience within all four to be able to say I'm more of less a Senior Engineer. I'm looking forward to being able to run a much bigger project and within the next five years, that's what I look to be able to do.
